

ROBOT-BASED AUTOMATION SYSTEM FOR CRYOGENIC CRYSTAL SAMPLE MOUNTING

Abstract of the Disclosure

A method and robot-based automation system are provided for
5 cryogenic crystal sample mounting, for example, for use for cryogenic crystal
sample mounting in the x-ray crystallography station at an x-ray source. The
system includes a robot arm carrying a handset. The handset includes a
pair of elongated fingers for sample mounting, and each finger carrying a set
of strain gauge arrays for providing force sensing. A slim finger design
10 allows a sample mounting process with no interference with the beam stop,
cryostream and x-ray detectors. The handset can detect the contact force
intensity and direction; provide a precise gripping action; and feel the results
of the gripping. The finger design incorporates a mechanism to maintain the
sample temperature well below the cryogenic safety margin for the crystal
15 viability. A Dewar container is provided with an ice control system and liquid
nitrogen flow control. A triangular sample magazine maximizes the Dewar
space usage. A miniature kinematical mounting sample holder provides
near micron positioning repeatability. These capabilities make the robot-arm
more powerful, flexible, and reliable.
